# The Chapman-Kolmogorov Relation

---

- Explain what the Chapman-Kolmogorov relation can be used to compute.
- Explain how the probability that  $P(T_3 = b \wedge T_2 = c | T_1 = a)$  is computed from elements of the 1-step transition probability matrix and the justification for calculating this quantity in this way.
- Hence, explain how the probability that  $P(T_3 = b | T_1 = a)$  is computed from the elements of the 1-step transition probability matrix and the justification for calculating this quantity in this way.
- Give a statement of the Chapman-Kolmogorov relation

# The Chapman-Kolmogorov Relation

---

- Give what you have learnt in this video write an expression for the conditional probability  $P(T = 4 = a | T_1 = a)$  using summation notation. Hint: there will be two summation signs in your expression.
